1 Introduction

1.1.1 Charles & Associates Consulting Engineers Ltd. (C&A) have been instructed by Kent County Council (KCC) to provide ongoing technical support in relation to a S106B planning appeal by the developer of the Chilmington Green development in Ashford, Kent. Specifically, C&A have been asked to provide transport modelling support to evidence KCC Highway's position at the forthcoming appeal.

1.1.2 Chilmington Green is a large-scale mixed-use development including up to 5,750 residential dwellings to the southwest of Ashford town centre. It is required to financially contribute towards the implementation of the scheme on the A28 Chart Road as part of its planning consent (ref: 12/00400/AS) enshrined in a S106 agreement.

1.1.3 The proposed improvement scheme comprises the conversion of the A28 Chart Road, between the 'Tank' and 'Matalan' roundabouts from single lanes to two lanes in each direction. This will incorporate the improvement of both roundabouts and the Chart Road/Loudon Way signalised junction.

1.1.4 The Appellant is seeking to discharge the condition without delivering the consented mitigation scheme as part of the S106B appeal. KCC maintain that mitigation of the A28 corridor is required in the context of delivery of 5,750 homes and other land uses at Chilmington Green and have instructed the development of a microsimulation model of the network to demonstrate the impact of the development in the absence of mitigation.

1.1.5 This report provides information regarding the calibration and validation of the base model for the A28 corridor. The report discusses how the model was calibrated and validated against on-street conditions, with reference to the UK Transport Analysis Guidance (TAG)[1], which was updated in 2024, and the Transport for London Modelling Guidance version 4[2].

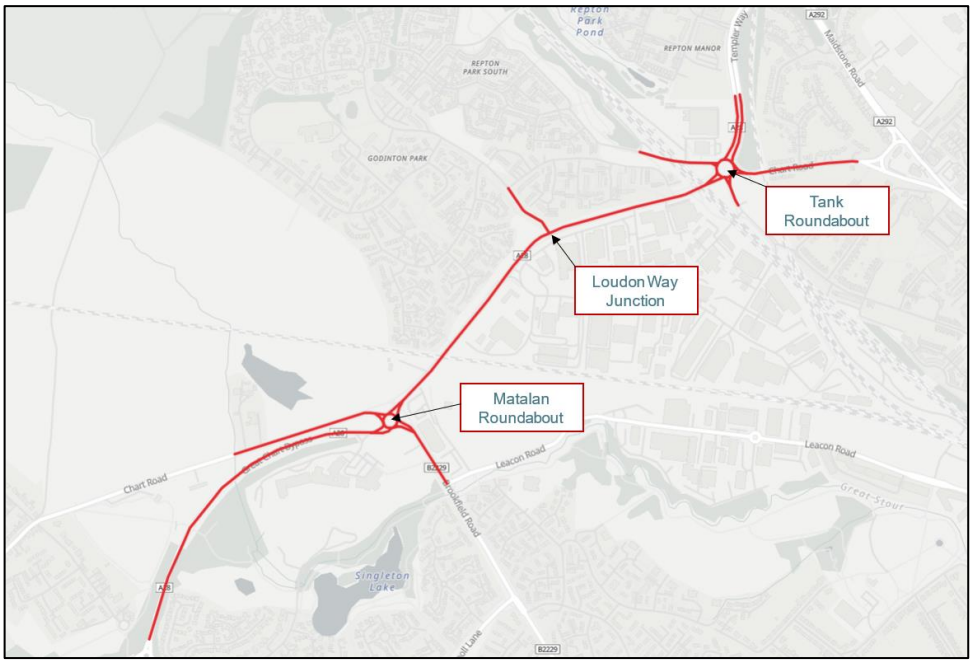
2 Data Collection

2.1 Extend of Study Network

2.1.1 As shown in the **Figure 2.1** below the modelled network comprises the A28 Chart Road corridor along with the Matalan Roundabout, Loudon Way signalised junction and Tank Roundabout with all corresponding entry/exit arms.

Figure 2.1: Extent of Study Network



2.1.2 The Tank roundabout consists of 5 arms, A28 Chart Road, Sir Henry Brackenbury Road, A28 Templer Way, Chart Road and Carlton Road. The Loudon Way junction comprises the signalised intersection of the A28 Chart Road, running northeast to southwest, with Loudon Way staring from the junction and running to a northwest direction. To the south of the study network, the Matalan roundabout includes the A28 Chart Road, Brookfield Road, the A28 Great Chart Bypass and Chart Road.

2.2 Traffic Flows

2.2.1 Traffic surveys were conducted on Tuesday 25th April 2023, where peak period turning counts and queue lengths at the Tank Roundabout, the Matalan Roundabout and Chart Road/Loudon Way junction were obtained. The full survey data is provided in **Appendix A**.

2.2.2 The total network flows were calculated as shown in the **Table 2.1** below to establish the peak periods within the study network.

Table 2.1: Hourly Network Flows

AM Period	AM Total Network Movements	PM Period	PM Total Network Movements
0700-0800	7587	1600-1700	7747
0715-0815	8114	1615-1715	7887
0730-0830	**8224**	1630-1730	7920
0745-0845	8139	1645-1745	7870
0800-0900	8152	**1700-1800**	**7969**
0815-0915	7914	1715-1815	7862
0830-0930	7548	1730-1830	7676
0845-0945	7289	1745-1845	7286
0900-1000	6873	1800-1900	6726

2.2.3 As can be seen from the figures above, it was established that the busiest periods for the network were from 07:30 to 08:30 in the AM and from 17:00 to 18:00 in the PM.

2.2.4 Additional journey time surveys were undertaken in December 2024 to supplement the original dataset. Manual observer journey time surveys were captured for the main routes through the model network. The full survey data is provided in **Appendix A**. In addition, further site observations through drone footage and sample traffic counts were undertaken to enable a comparison of network conditions between the datasets.

2.2.5 The site observations have been undertaken to enable the on-street traffic conditions on the network to be fully understood. As such C&A undertook site visits on Wednesday 3rd and Thursday 4th of December 2024 during both the AM and PM peak highway periods to coincide with the independently collected journey time data and understand the traffic conditions to help inform the development of the microsimulation model. The site visit was combined with the use of a drone which allowed to better record the traffic behaviour and performance of A28 corridor during both peaks on both days.

2.2.6 Prior to this, a site visit on Tuesday 25th April 2023 during both the AM and PM highway period was also conducted to coincide with the independently collected junction turning count and queue length.

2.2.7 The 2024 sample counts were conducted along A28 SB and NB and respective site visits and queue observations confirmed that the traffic conditions between 2024 and 2023 were at similar levels.

2.2.8 The hourly flow comparison summary is presented in **Table 2.2** below.

Table 2.2: A28 Corridor 2023 Vs 2024 Hourly Flow Comparison

	Peak	Hourly Flows		Variation	
		A28 NB	A28 SB	A28 NB	A28 SB
2023 Surveys	AM	1197	1238		
	PM	1141	1330		
2024 Sample Counts	AM	1353	1458	13.0%	17.8%
	PM	1286	1524	12.7%	14.6%
Average	AM	1321	1257	10.4%	1.6%
	PM	1261	1571	10.5%	18.1%

2.2.9 As a result, the 2023 turning counts and the 2024 journey times were used in combination for the base model, the former as model input and the latter for validation purposes, as further discussed below.

3 General Observations

3.1 Peak Hour Operation

3.1.1 As discussed above, site visits were undertaken on the days of the traffic surveys, both in 2023 and 2024. Overall, the site observations indicated that the A28 corridor within the study area experiences peak period congestion and delays.

3.1.2 The A28 corridor is tidal in nature, with the A28 northbound flow being more dominant during the AM peak, while the A28 southbound flow predominates during the PM peak. This results in significant northbound queues in the AM peak at the Matalan roundabout, particularly on the A28 Great Chart Bypass and Chart Road as well as Brookfield Road, with southbound queues in the PM peak both along the A28 corridor as well as the southbound approach to the Tank roundabout from the A28 Templer Way and the A292 gyratory.

3.2 Exit Blocking

3.2.1 As a result of the tidal nature of the corridor, the northbound A28 Chart Road exit at the Matalan roundabout and the southbound A28 Chart Road exit at the Tank roundabout both experience high levels of demand. Both exits start as two lanes rapidly merging into one.

3.2.2 During the site visits it was established that the merge on exit causes exit blocking at the Matalan Roundabout, during the AM peak, due to the level of demand and the imminent merge. The exit blocking and queues as observed, is shown in the **Figure 3.1** below.

Figure 3.1: Exit Blocking at Matalan Roundabout

3.2.3 During the PM peak, queues were observed along A28 Chart Road that extended towards Tank roundabout. The queue and slow-moving traffic on the southbound A28 corridor, along with the pedestrian crossing just downstream from the Tank roundabout and the high southbound demand of the PM peak caused exit blocking on A28 Chart Road southbound, which in turn led to further queues extending back to the A292 gyratory and Templer Way. The exit blocking and queues, as observed, is shown in the **Figure 3.2** below.

Figure 3.2: Exit Blocking at Tank Roundabout

3.2.4 Cooperative merging was seen at both exit merges, while unequal lane use at all entry arms was detected, in anticipation of the exit blocking and merging. For the Matalan roundabout, this manifested in traffic from Brookfield Road with a northbound direction using the offside lane, while traffic from the A28 Great Chart bypass and Chart Road going into the A28 northbound both using the nearside lane. For the Tank roundabout, this is seen as nearside queuing for Chart Road and Carlton Road.

3.2.5 The high demand and slow-moving traffic along the southbound A28 corridor also result in exit blocking at the Loudon Way signals. Traffic coming out from Loudon Way with a southbound direction are sometimes unable to clear due to slow moving traffic on the southbound A28 Chart Road, as shown in the **Figure 3.3** below.

Figure 3.3: Queues on Loudon Way

3.3 Pedestrian Crossings

3.3.1 The A28 corridor incorporates two pedestrian crossings: a signalised pedestrian crossing downstream from the Tank roundabout and an informal crossing in the vicinity of the Matalan roundabout. As both of these crossings are contributing factors to the exit blocking and the delays along the corridor, they have both been included in the microsimulation model.

Figure 3.4: Pedestrian Crossing South of Tank Roundabout

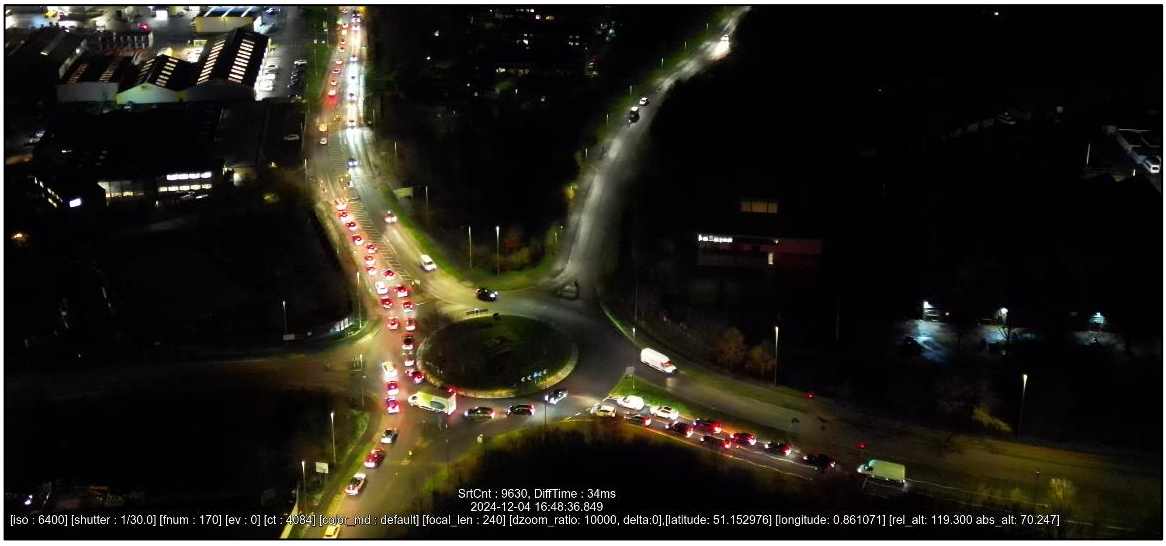


Figure 3.5: Informal Pedestrian Crossing at Matalan Roundabout

3.4 Rail Crossing

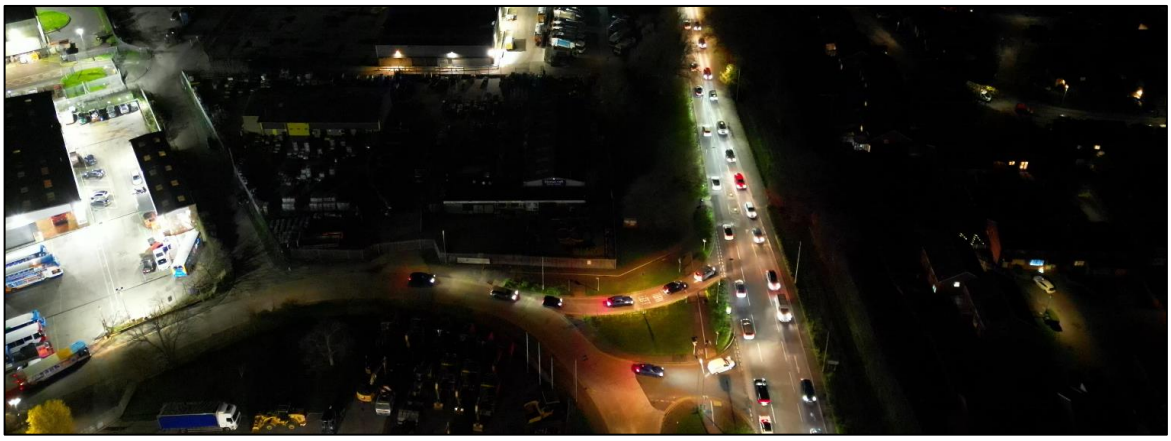
3.4.1 During the site visits it was also observed that traffic was moving with reduced speeds in the vicinity of the railway bridge crossing, just north of the Matalan roundabout, which contributed to the queues along the main corridor. This situation is shown in **Figure 3.6** below.

Figure 3.6: Vehicles Slowing Down at Railway Overbridge

3.5 Cobbswood Industrial Estate

3.5.1 A final contributing factor to the slow-moving traffic and queue-building conditions along the corridor is traffic demand to and from the Cobbswood Industrial Estate. Slow-moving traffic along the main corridor showed a cooperative behaviour in allowing vehicles in and out from the side roads leading to the industrial estate. This situation, observed during the site visits, is shown **Figure 3.7** below.

Figure 3.7: Vehicles Turning Left onto A28 SB From Cobbswood Industrial Estate



3.5.2 There were also occasions when vehicles turning right from Cobbswood Industrial Estate onto A28 Chart Road northbound contributed to the already established queues, as shown in **Figure 3.8** below.

Figure 3.8: Vehicles Turning Right from Industrial Estate onto A28 Chart Road Nb

4 Model Development and Calibration

4.1 VISSIM Model Specifications

4.1.1 The model has been developed in VISSIM software. A 2023 base year model was developed to accurately reflect the road network and observed traffic conditions. Although the model was based on surveys conducted in 2023, subsequent 2024 surveys and site visits confirmed that the traffic conditions in both years were at similar levels. As a result, turning counts from 2023 were used as model input while the model validation was carried out using journey time surveys from 4th December 2024. Additionally, the queues observed during both the 2023 and 2024 surveys were documented and compared for each survey year, and these were further compared with the model for visual validation

4.1.2 The developed model is a static assignment model with 5 model steps per simulation second, in accordance with the TfL Guidance.

4.2 Time Periods

4.2.1 The model reflects the observed weekday peak hours outlined above plus 15 minutes of warm-up and cool-down ‘shoulder’ periods, so each model runs for 90 minutes in total. In these shoulder periods, surveyed flows were used.

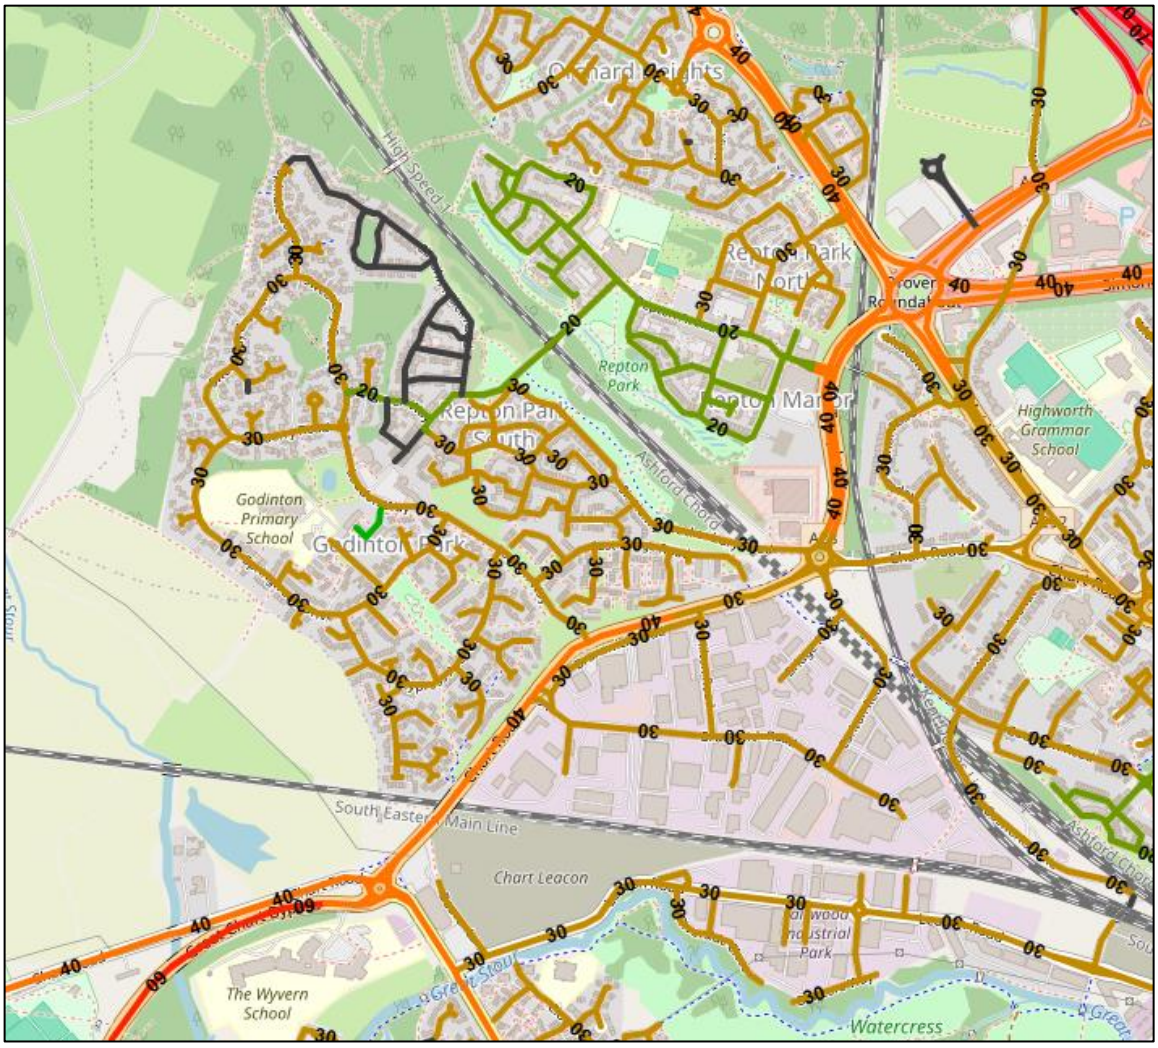
4.3 Highway Geometry

4.3.1 The model has been coded using the aerial base mapping available in VISSIM. Each road has been coded using a continuous link as far as possible to allow for smoother vehicle cruising within the model.

4.4 Traffic Speeds

4.4.1 Desired Speed Decisions have been used to reflect posted speed limits on the network as shown in **Figure 4.1** below.

Figure 4.1: Speed Limits in Study Area[3]



4.4.2 Reduced Speed Areas were introduced at a number of locations to:

1. Reflect the slowing down at turns and entry lanes at the roundabouts.
2. Model the saturation flows at the signalised junctions, both the Loudon Way signals as well as the signalised pedestrian crossing as vehicles clear the signals more conservatively than the speed limit indicates.
3. At the A28 merging points both at the Matalan and the Tank roundabout exits of the A28 to more accurately model the merging and cooperative behaviour of the merges.
4. At Brunswick Road leading to the industrial estate, to better reflect the cooperative behaviour of the traffic on the A28 allowing movements from the side road.
5. In the proximity of the bridge crossing along A28 to reflect the hesitation and slowing down of vehicles when going through this section of the network; and lastly

[3] OpenStreetBrowser: https://www.openstreetbrowser.org/

6. In general, along the A28 corridor to replicate the cruise speeds as observed during site visits and are a result of the cautious driving along the corridor due to the multitude of different types of activity discussed above.

4.5 Traffic Inputs and Routes

4.5.1 The model includes two vehicle compositions based on observed flows – 'Light Vehicles' including cars and vans, and 'Heavy Vehicles' including HGVs. These have been used to generate separate 'Vehicle Input' and 'Static Routes' between each origin and destination route.

4.5.2 Vehicle inputs were put at the outer link of the network, differentiating between Lights and Heavies, while vehicle route choices were coded at each junction of the network.

4.5.3 For the junctions of the A28 with the industrial estate side roads, demand was calculated as the difference of the surveyed flows between the roundabouts and the Loudon Way signals. This was considered a reasonable approach, given the lack of other network entry/exit points within the corridor, to allow for a sufficient level of movements between the main corridor and the side roads.

4.5.4 Pedestrian demand for the signalised pedestrian crossing was provided by KCC (**Appendix B**) while an indicative demand was used for the unofficial pedestrian crossing at the Matalan roundabout, based on demand experienced during the site visits.

4.6 Priority Rules

4.6.1 Priority Rules were used at the entry arms of both roundabouts and were calibrated at each entry arm in order to balance the level of flows entering the roundabouts.

4.6.2 Priority rules were also used at the junctions with Brunswick Road where queues in the southbound movement are a more frequent occurrence. This was done so that slow moving vehicles on the A28 corridor would allow turning traffic in and out of the side road, as was observed during the site visits.

4.7 Traffic Signals

4.7.1 Phasing and Staging information relating to the traffic signals at Loudon Way were provided by KCC (**Appendix C**) while stage and cycle times were modelled as observed during the site visits.

4.7.2 The summary of signal times during both peak periods is presented in **Figure 4.2** and **Figure 4.3** below.

Figure 4.2: A28/Loudon Way Signal Times - AM Peak

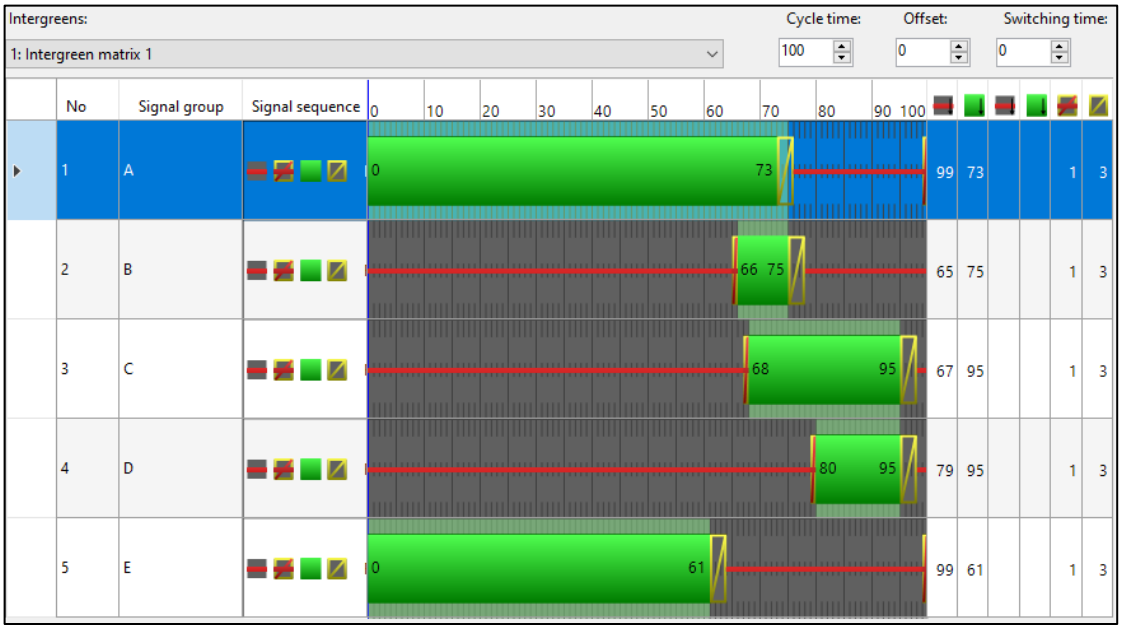


Figure 4.3: A28/Loudon Way Signal Times - PM Peak

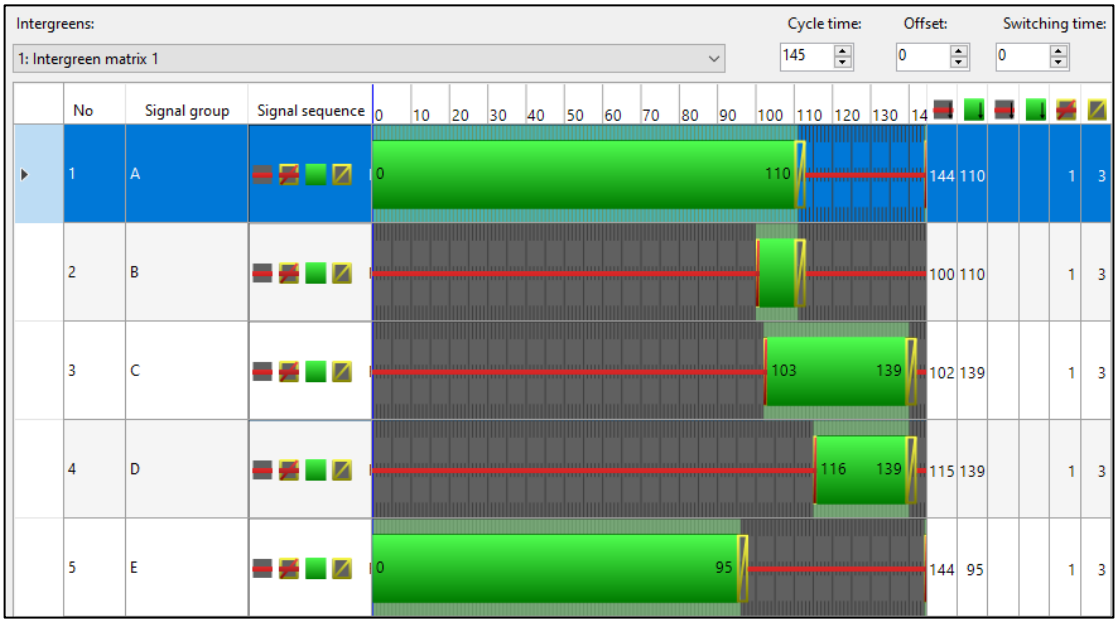


4.7.3 The toucan crossing south of the Tank roundabout was modelled as demand dependant with a minimum green time of 10 seconds for the traffic movement and 5 seconds for the pedestrian movement.

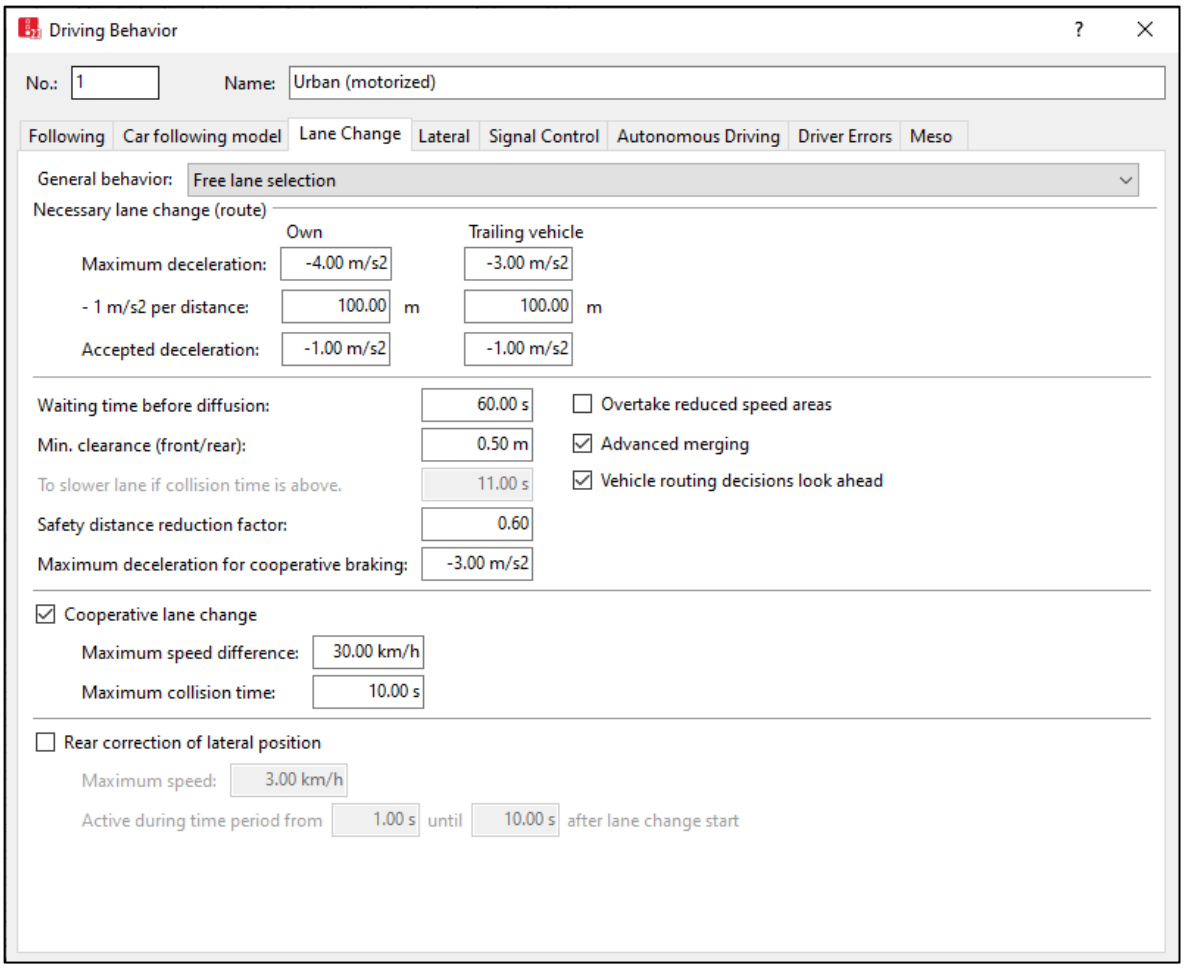
4.8 Public Transport

4.8.1 Public transport lines and stops were modelled and timetable information used for buses going through the network during the peak periods. This involves lines 666, G and 2 eastbound and 969, WS1 and 965 northbound for the AM peak period, and lines 666 and G eastbound and WS1 southbound for the PM peak period. Timetables can be found in **Appendix D**.

4.9 Driving Behaviour

4.9.1 Driving behaviour was changed from default parameters to allow for the cooperate behaviour observed on the ground. The cooperative lane change was selected under the Lane Change parameters, with a maximum speed difference of 30 km/h which was the value that best matched the observed conditions.

Figure 4.4: Driving Behaviour – Lane Change Parameters



5 Model Validation

5.1 Overview

5.1.1 To confirm the suitability of the base model for use as a forecasting tool, the model must be subject to a validation process. The validation process includes a comparison of the model and the actual network's operation, using certain performance criteria. The criteria used for validation should be based on data independent from the model development and calibration process.

5.1.2 Although two separate exercises, in practice there is a need to iterate between the two; revisiting the calibration process and making further refinements, where initial validation was unsuccessful. However, the model should not be constructed on the basis of the validation data. The results presented in this section, and as presented in previous chapter, correspond to the same final validated base model.

5.1.3 As noted above, all validation data from the model was obtained through averaging of five random seeds.

5.2 Traffic Flows

5.2.1 The percentage difference between data sets can prove to be misleading given the relative value of the difference. The standard method therefore involves the calculation of the GEH statistic, which incorporates both the relative and the absolute errors.

5.2.2 For a given vehicle flow, the GEH statistic compares the modelled flow (M) with the observed flow (C) as follows.

$$GEH = \sqrt{\frac{(M-C)^2}{(M+C)/2}}$$

5.2.3 In general, a GEH value of < 5 is considered an acceptable fit and conversely, a value >10 requires closer attention. According to TAG[4] the GEH value should not exceed 5.0 for 85% of assessed flows. TfL guidance also states that flows on entry links should have a GEH < 3.0.

5.2.4 The AM flow comparison between observed and modelled flows is presented in **Table 5.1** below. The flow difference between the observed and modelled flows are within 15% for all of the links except Sir Henry Brackenbury exit, where the flows are very low, and a small deviation can manifest as a high percentage difference.

[4] TAG Unit M3.1 Highway Assignment Modelling – Table 2

Table 5.1: AM Flow Comparison

Entry/Exit Link	Observed Flow	Model Flow	Diff	% Diff	GEH Value
Sir Henry Brackenbury Rd Eb_entry	108	112	4	4%	0.4
A28 Templer Way_entry	1060	1032	-28	3%	0.9
Chart Road (N)_entry	388	363	-25	6%	1.3
Carlton Rd_entry	114	116	2	2%	0.2
Loudon Way_entry	397	384	-13	3%	0.7
Brookfield Rd_entry	768	794	26	3%	0.9
A28 Great Chart Bypass_entry	420	406	-14	3%	0.7
Chart Rd (S)_entry	335	317	-18	5%	1.0
Sir Henry Brackenbury Rd Eb_exit	37	67	30	81%	4.2
A28 Templer Way_exit	959	850	-109	-11%	3.6
Chart Road (N)_exit	436	492	56	13%	2.6
Carlton Rd_exit	190	184	-6	-3%	0.4
Loudon Way_exit	244	242	-2	-1%	0.1
Brookfield Rd_exit	663	624	-39	-6%	1.5
A28 Great Chart Bypass_exit	797	750	-47	-6%	1.7
Chart Rd (S)_exit	104	105	1	1%	0.1
A28 Chart Road_exit	1197	1197	0	0%	0.0

5.2.5 The table above shows that all the entry link flows are within a GEH value of less than 3, and all of the exit flows are also the recommended GEH value of 5.

5.2.6 The PM flow comparison between observed and modelled flows is presented in **Table 5.2** below. The flow difference between the observed and modelled flows are within 15% for all of the links except Chart Road (N) exit.

Table 5.2: PM Flow Comparison

Entry/Exit Link	Observed Flow	Model Flow	Diff	% Diff	GEH Value
Sir Henry Brackenbury Rd Eb_entry	50	47	-3	6%	0.4
A28 Templer Way_entry	972	881	-91	9%	3.0
Chart Road (N)_entry	289	279	-10	3%	0.6
Carlton Rd_entry	163	159	-4	2%	0.3
Loudon Way_entry	297	296	-1	0%	0.1
Brookfield Rd_entry	811	837	26	3%	0.9
A28 Great Chart Bypass_entry	499	513	14	3%	0.6
Chart Rd (S)_entry	255	268	13	5%	0.8
Sir Henry Brackenbury Rd Eb_exit	93	90	-3	-3%	0.3
A28 Templer Way_exit	966	875	-91	-9%	3.0
Chart Road (N)_exit	358	428	70	20%	3.5
Carlton Rd_exit	103	97	-6	-6%	0.6
Loudon Way_exit	307	305	-2	-1%	0.1
Brookfield Rd_exit	817	787	-30	-4%	1.1
A28 Great Chart Bypass_exit	797	753	-44	-6%	1.6
Chart Rd (S)_exit	140	141	1	1%	0.1
A28 Chart Road_exit	1141	1184	43	4%	1.3

5.2.7 Similar to the AM flow comparisons, all entry links have a GEH of less than 3 with all exit links being under the suggested value of 5. As a result, the model is considered to validate well in regard to traffic flows.

5.3 Visual Calibration and Queuing

5.3.1 The site observations indicated that the A28 corridor within the area of the proposed improvement scheme observes peak period congestion and delays.

5.3.2 As already discussed, the A28 corridor is tidal in nature, with the A28 northbound flow being dominant during the AM peak, while the A28 southbound flow predominates during the PM peak.

5.3.3 The visual calibration between observed and modelled queues is discussed below.

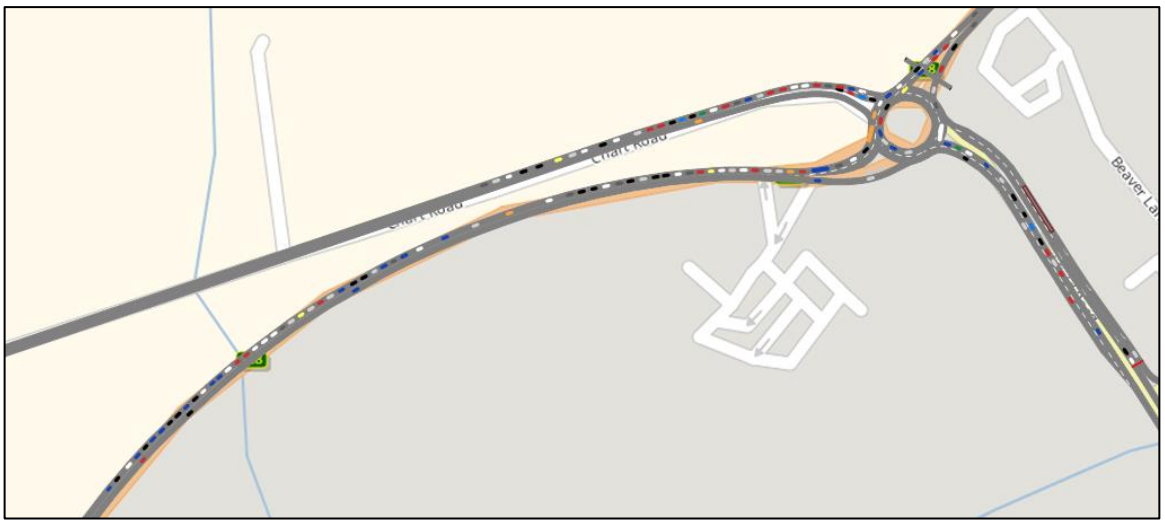
Matalan Roundabout

5.3.4 During the AM peak at Matalan roundabout, queues were observed on Brookfield Road, the A28 Great Chart Bypass, and Chart Road as they approached the roundabout, with the queuing continuing throughout the peak period.

5.3.5 Most of the queuing took place in the nearside lane of the A28 Great Chart Bypass and the offside lane of Brookfield Road, as shown in **Figure 5.1** and **Figure 5.2** below.

Figure 5.1: Observed Queue Building Along A28 Great Chart Bypass (AM Peak)

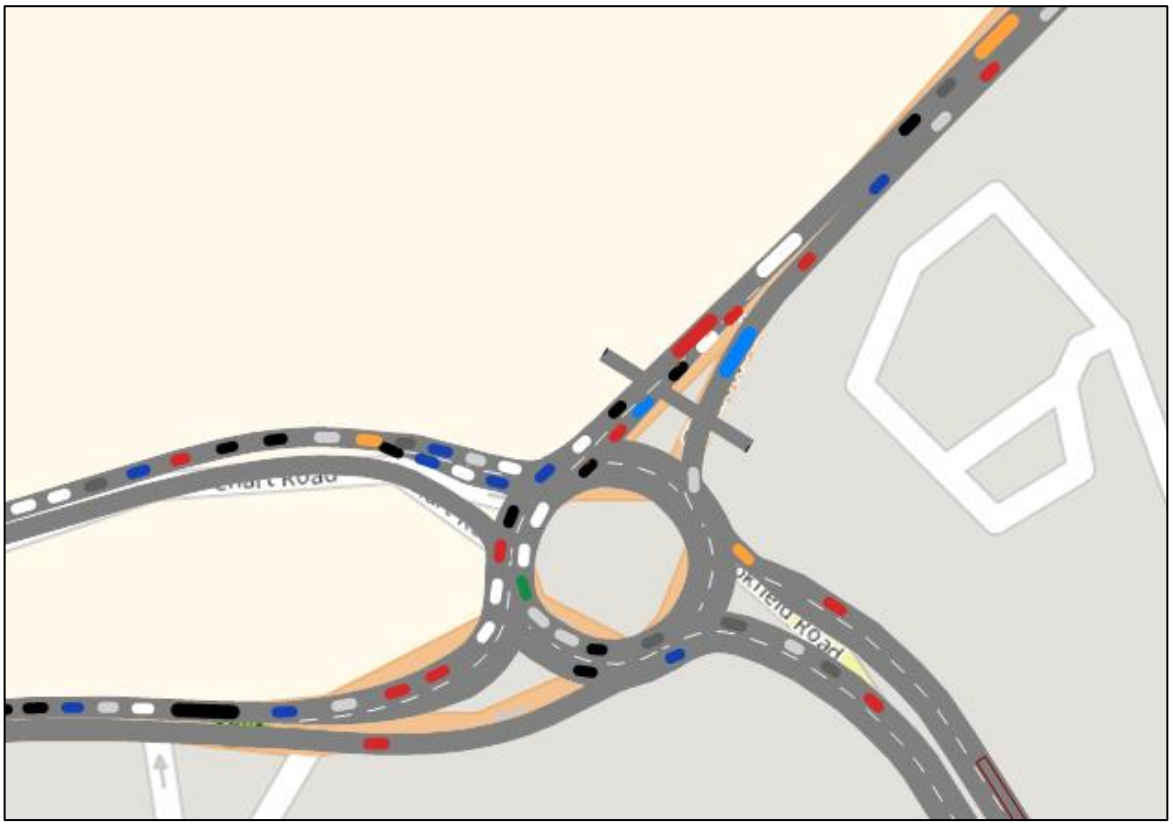
Figure 5.2: Modelled Queue Building along A28 Great Chart Bypass (AM Peak)



5.3.6 A contributing factor to the queues discussed above was the exit blocking on A28 Chart Road, as shown in the **Figure 5.3** and **Figure 5.4** below, which caused vehicles to queue on the circulatory carriageway of Matalan roundabout.

Figure 5.3: Observed Exit Blocking at Matalan Roundabout

Figure 5.4: Modelled Exit Blocking at Matalan Roundabout



Loudon Way/A28 Chart Road Signalised Junction

5.3.7 During the AM peak, queues were observed on the A28 Chart Road northbound. These queues were found to have two segments: the first starting from the Matalan roundabout and extending to the end of the railway bridge, and the second starting at a gap in the first queue and continuing up to the Loudon Way junction.

5.3.8 Queues were also observed on Loudon Way, particularly in the AM peak, with exit blocking for the southbound traffic from Loudon Way occurring in some instances, predominantly in the PM peak.

Figure 5.5: Observed Queues Along Loudon Way (AM Peak)

Figure 5.6: Modelled Queues Along Loudon Way (AM Peak)

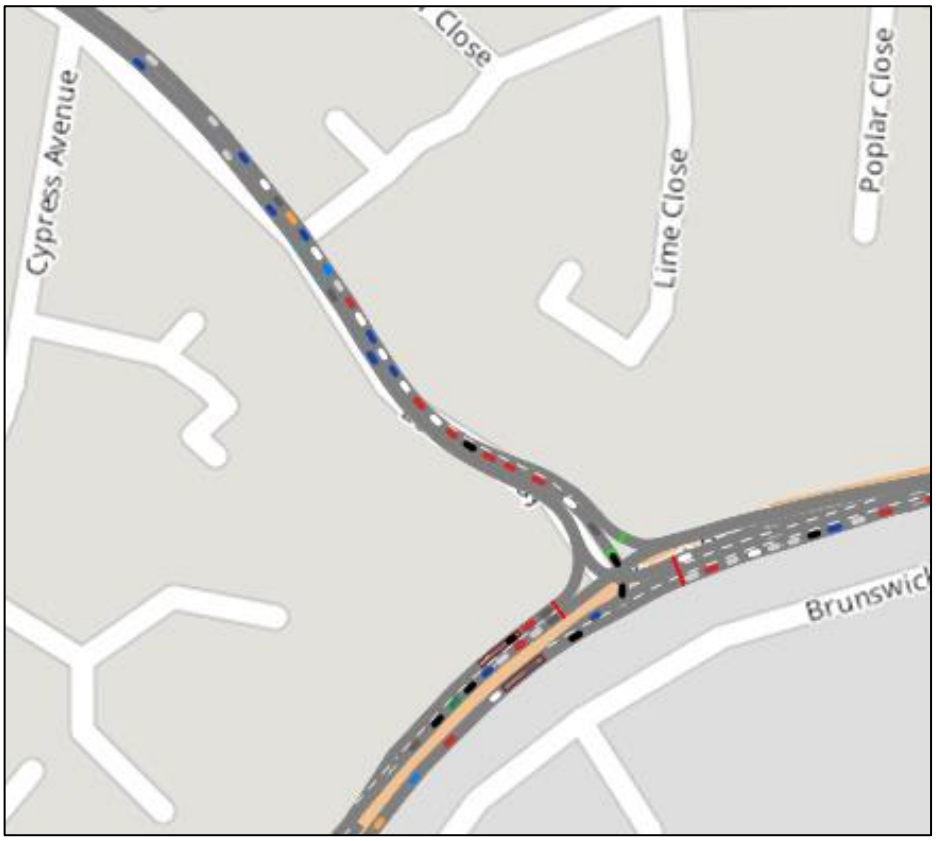


Figure 5.7: Observed Exit Blocking at Loudon Signals for SB Traffic (PM Peak)

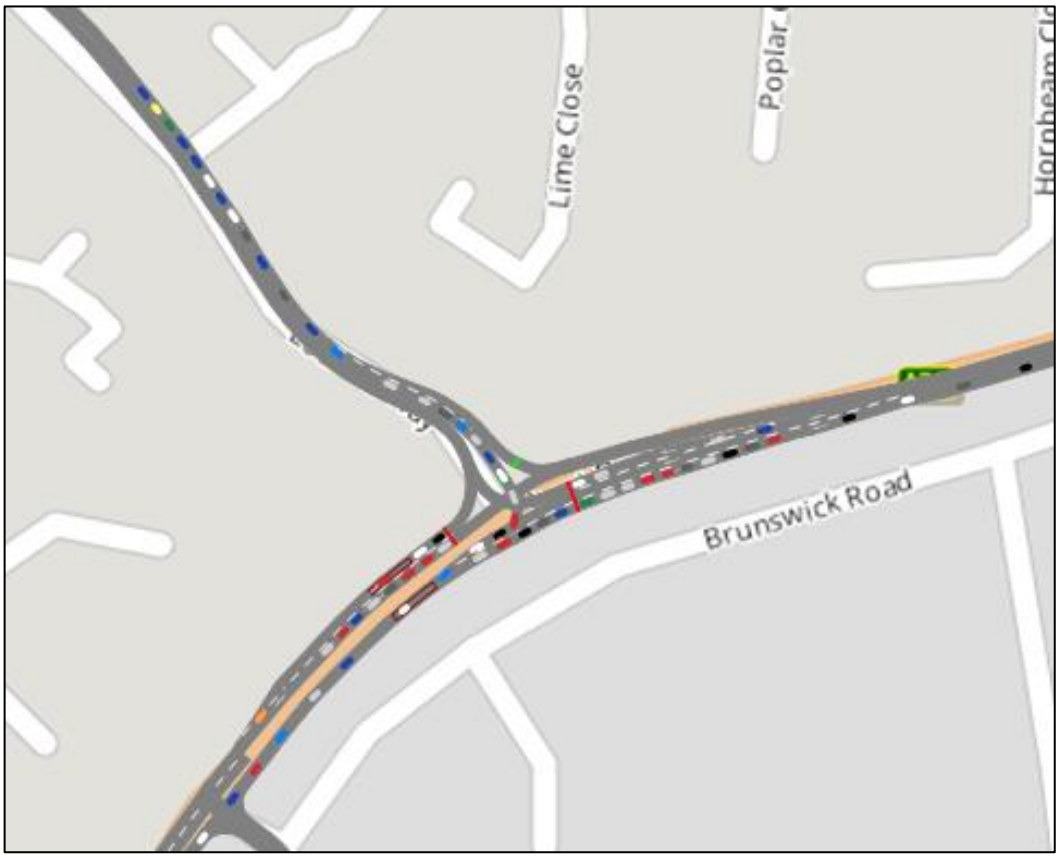
Figure 5.8: Modelled Exit Blocking at Loudon Signals for SB traffic (PM Peak)



Tank Roundabout

5.3.9 During the PM peak, queues were observed along A28 Chart Road, starting at the Loudon Way junction and extending towards Tank roundabout. These queues caused exit blocking on A28 Chart Road southbound, which in turn led to further queues extending back to the A292 gyratory and Templer Way. The exit blocking and queues, as observed and modelled, are shown **Figure 5.9** - **Figure 5.12** below.

Figure 5.9: Observed Exit Blocking at Tank Roundabout (PM Peak)

Figure 5.10: Modelled Exit Blocking at Tank Roundabout (PM Peak)

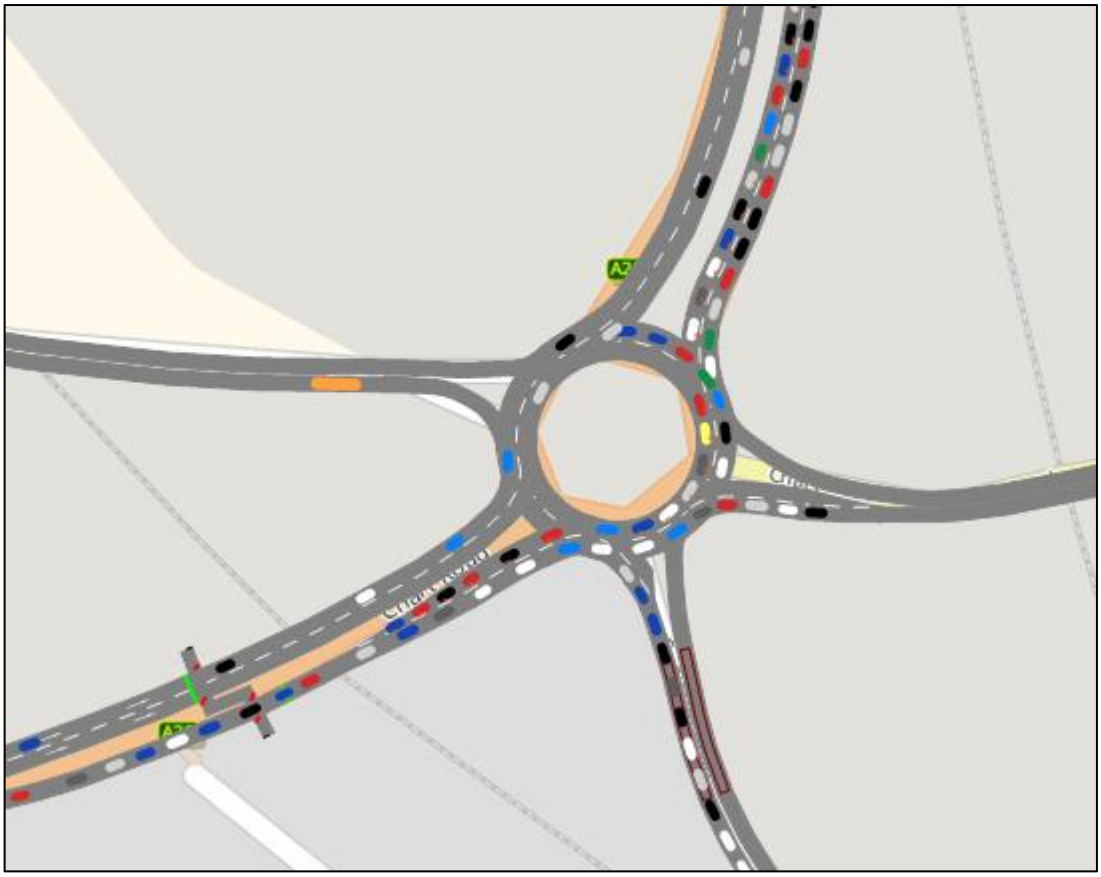


Figure 5.11: Observed Queues on A28 SB Back to Tank Roundabout (PM Peak)

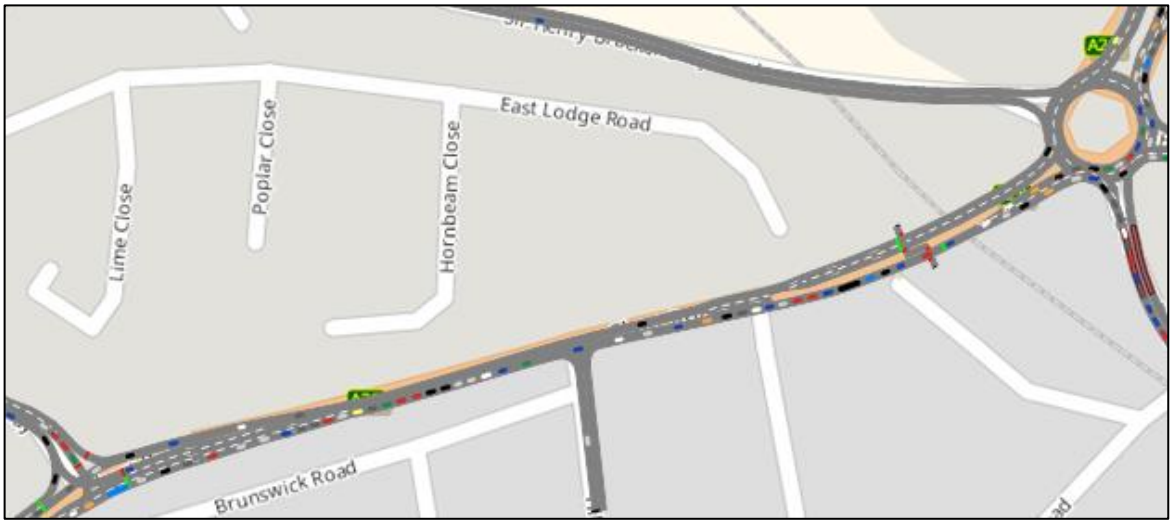
Figure 5.12: Modelled Queues on A28 SB Back to Tank Roundabout (PM Peak)



5.3.10 The observed and modelled queues along Chart Road and A28 Templer Way are shown in **Figure 5.13** - **Figure 5.16** below.

Figure 5.13: Observed Queues on Chart Road (PM Peak)

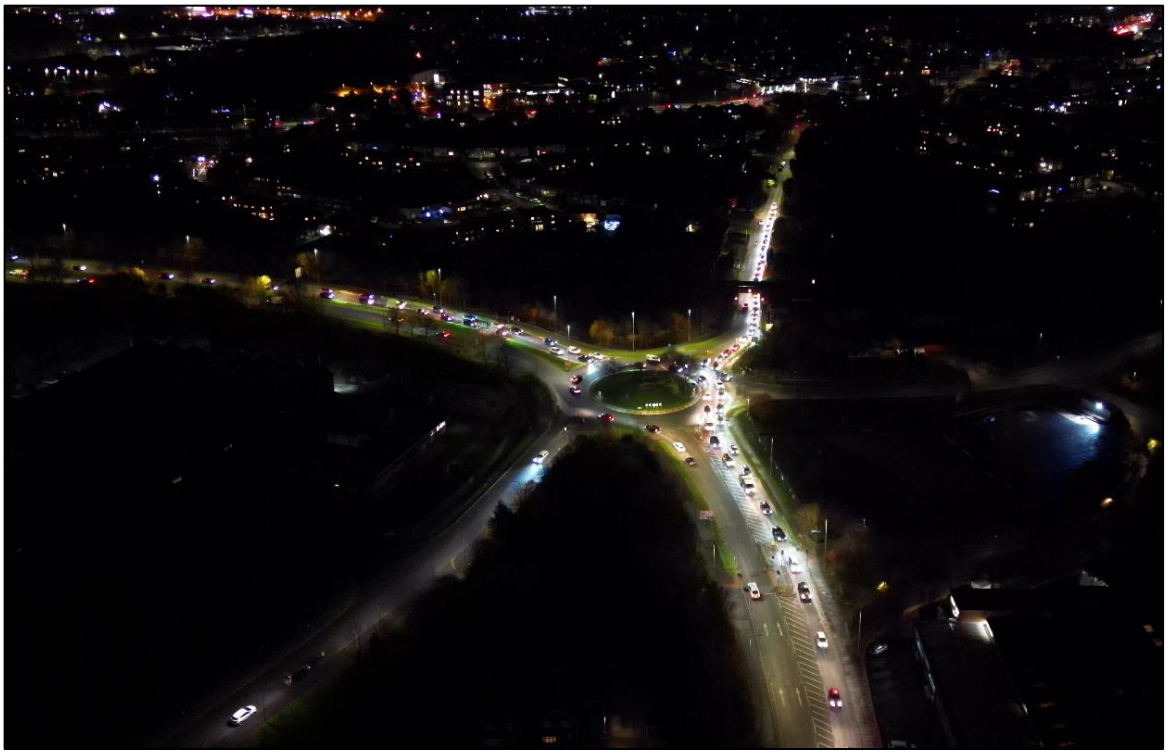


Figure 5.14: Modelled Queues on Chart Road (PM Peak)

Figure 5.15: Observed Queues on A28 Templer Way (PM Peak)

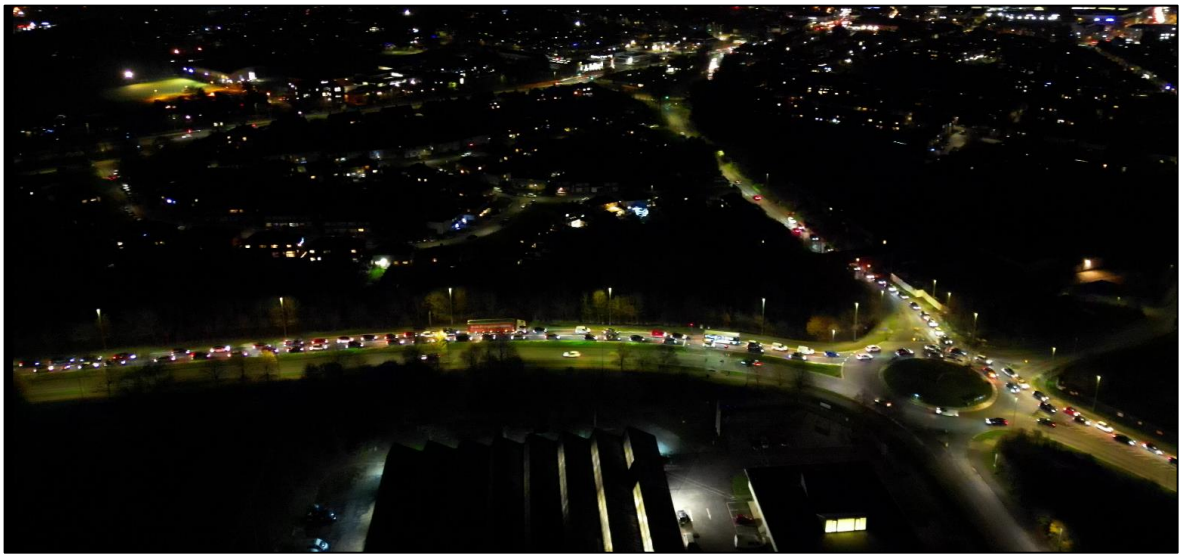

Figure 5.16: Modelled Queues on A28 Templer Way (PM Peak)

5.4 Journey Times

5.4.1 In relation to journey times, TAG states[5]:

"4.3.20 For general purpose models, the routes for the validation of journey times should cover as wide a range of route types as possible and cover the fully modelled area in the model as evenly as possible. For models developed for the appraisal of specific interventions, routes should include those on which it is expected traffic will be affected by the scheme, as well as covering the route including the proposed scheme itself, if appropriate.'

5.4.2 Table 3 of the same unit gives the overall criteria for journey times as:

'Modelled times along routes should be within 15% of surveyed times (or 1 minute, if higher than 15%) for at least 85% of journey time routes.'

5.4.3 However, TAG's Appendix C – Microsimulation gives more specific criteria for journey time validation in a microsimulation context:

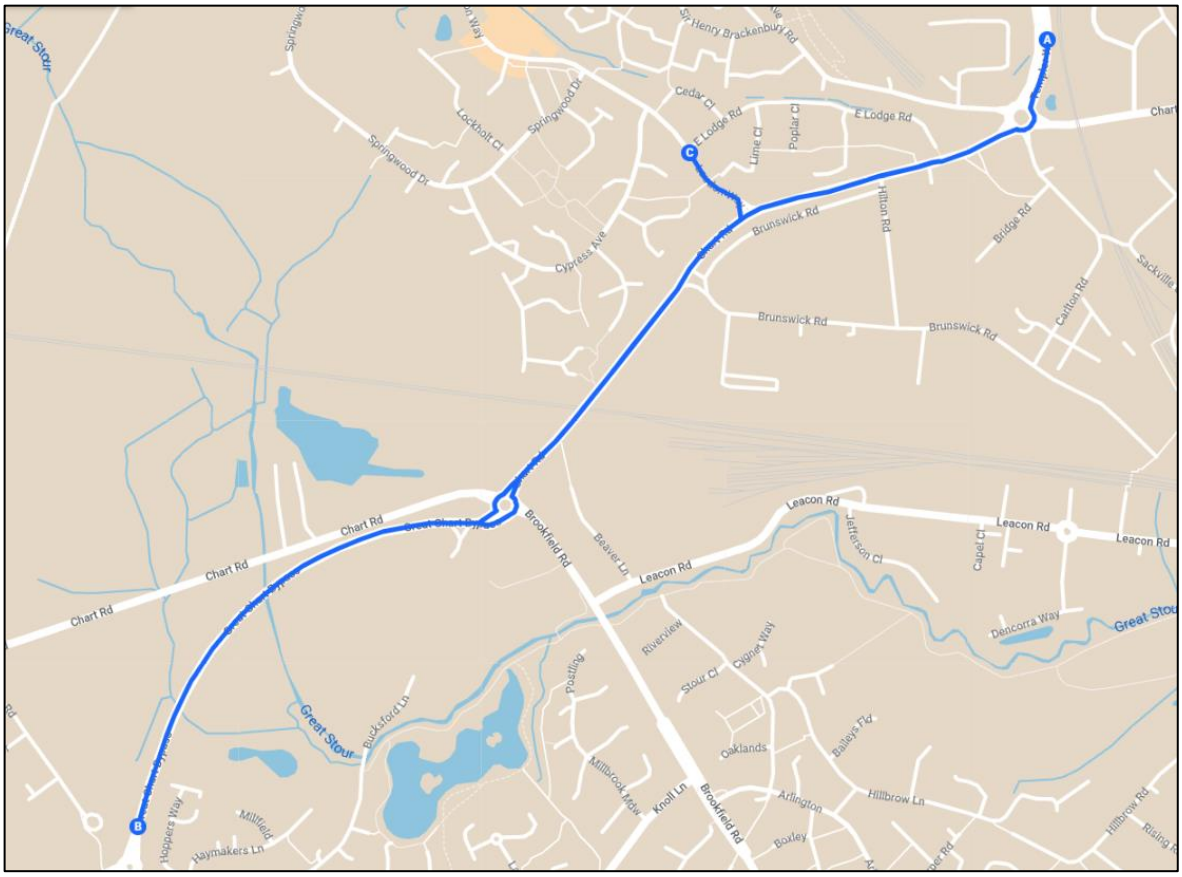
'C.3.10 Journey times should be considered as the key metric in the demonstration of model validation. With microsimulation modelling, it is recommended to achieve validation within 15% and within 60 seconds of observed values, instead of either/or as detailed in Table 3 of this unit for strategic highway assignment models [for 85% of routes]. For smaller models, the 60 second threshold can be too tolerant, whereas for larger models, the 15% tolerance can be too generous. Meeting both allows a high standard of validation to be achieved either way.

5.4.4 For the purpose of this model, in total, four routes were recorded during the journey time survey: A to B, B to A, B to C, and C to A. The floating car method was used to observe the journey times across all four routes.

5.4.5 Point A was located on Templer Way, north of Tank Roundabout; Point B was north of Tithe Barn Roundabout on the A28 Great Chart Bypass; and Point C was on Loudon Way, west of the Loudon Way/A28 junction, as shown in the **Figure 5.17** below.

[5] TAG Unit M1.2 Data Sources and Surveys

Figure 5.17: Journey Time Start and End Locations



5.4.6 The comparison of observed and modelled journey times for the AM peak is shown in the **Table 5.3** below.

Table 5.3: AM Journey Time – Observed Vs Modelled

Route	Observed (seconds)	Modelled (seconds)	Difference	% Diff.	GEH
B – A	527	502	-25	5%	1.1
B - C	453	492	38	8%	1.8
C – A	154	128	-26	17%	2.2
A – B	244	305	61	25%	3.7

5.4.7 As can be seen in the table above, all AM-modelled journey times, apart from A – B (which is only 1 second over the one-minute threshold), are within a minute of the surveyed times. Most routes are within the 15% difference threshold, and the GEH value is less than 5. Although Loudon Way to Templer Way journey time is slightly higher than the recommended 15% difference, this tolerance is considered acceptable as both Loudon Way and the toucan crossing signals may have a variance in actual signal times than the times used in the model.

5.4.8 Similarly, the Templer Way to A28 Great Chart Bypass route is at the 60 seconds threshold and within the GEH of 5. The deviation presented is considered acceptable as it involves the interaction with the Brunswick Road, flows of which were only indicative and not surveyed. Furthermore, given the tidal nature of the network, this route is considered of lesser importance in the AM peak as represents a lesser trafficked and subsequently congested route.

5.4.9 The comparison of observed and modelled journey times for the PM peak is shown in the **Table 5.4** below.

Table 5.4: PM Journey Time – Observed Vs Modelled

Route	Observed (seconds)	Modelled (seconds)	Difference	% Diff.	GEH
B – A	300	254	-46	15%	2.8
B - C	211	190	-21	10%	1.5
C – A	160	205	45	28%	3.3
A – B	475	446	-29	6%	1.3

5.4.10 As can be seen in table above, all PM modelled journey times are within a minute of the surveyed times, with most routes being within the 15% difference threshold and GEH value of less than 5.

5.4.11 As previously, it is acknowledged that the route from Loudon Way to Templer Way presents a higher percentile difference than the guidance suggests, but it is within a minute and with a GEH of less than 5. Tolerance for the higher percentile difference is considered appropriate due to the two traffic signals and the signal timings used.

6 Summary and Conclusions

6.1.1 C&A have been commissioned to produce a microsimulation traffic model of A28 corridor between Tank Roundabout and Matalan Roundabout.

6.1.2 The model reflects the conditions observed in the modelled network during the site visits, including the exit blocking at merging, the cooperative driving behaviour at both the merges as well as the junctions with the industrial estate minor roads, as well as the lower speeds at the bridge crossing.

6.1.3 In terms of traffic flows, the model demonstrates good validation against surveyed data, with all modelled flows meeting the GEH criteria.

6.1.4 The model also shows good validation of journey times against surveyed data, as well as visual validation against queues and driving behaviour.

6.1.5 In conclusion, the model is considered to validly represent observed conditions in the peak periods along the A28 corridor between Tank Roundabout and Matalan Roundabout and is fit for the purpose of forecasting changes in traffic demand within the network.

RE: USAGE OF THE CROSSING WEST OF TANK ROUNDABOUT

1.0 Introduction

1.1 The following tables have been prepared to respond to the Inspector's request for information on the use of the crossing on the A28 to the south of Tank Roundabout.

1.2 The information is from a survey undertaken on Tuesday 28th March 2023.

2.0 Usage

Table 2.1: Westbound AM Peak Hour

	Pedestrians Crossing				Green Man Called
	Crossed with Green Man	**Crossed before Green Man appeared**	**Crossed without calling Green Man**	**Total**	**No of times Green Man called**
0800-0815	9	1	3	13	7
0815-0830	7	2	3	12	5
0830-0845	5	0	4	9	3
0845-0900	2	2	4	8	4
Total	23	5	14	42	19

Table 2.2: Westbound PM Peak Hour

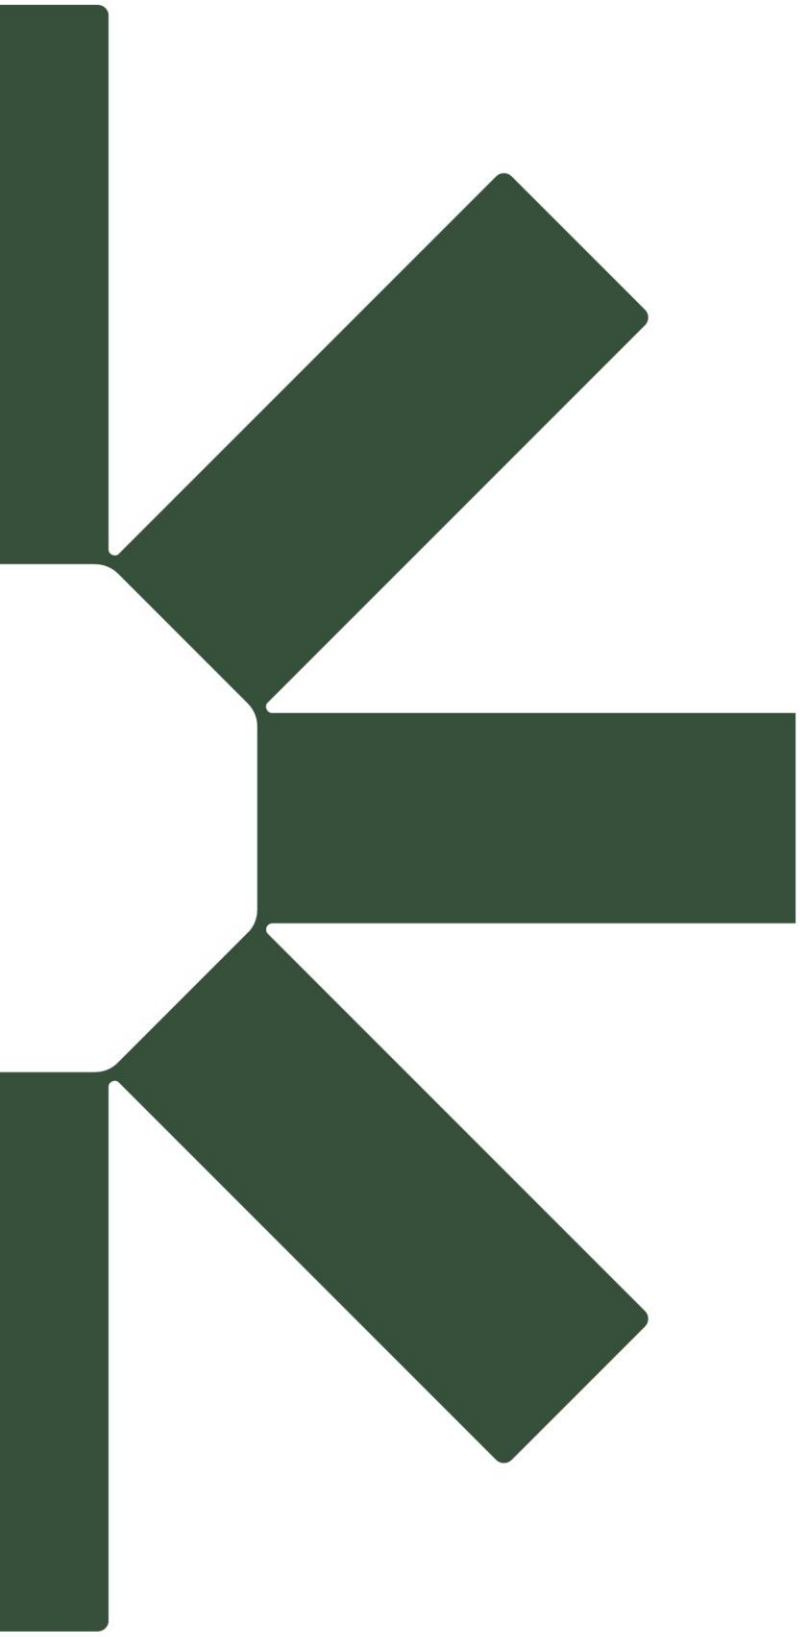
	Pedestrians Crossing				Green Man Called
	Crossed with Green Man	Crossed before Green Man appeared	Crossed without calling Green Man	Total	No of times Green Man called
1630-1645	0	2	1	3	2
1645-1700	3	1	5	9	3
1700-1715	5	6	3	14	6
1715-1730	4	0	1	5	3
Total	12	9	10	31	14

Table 2.3: Eastbound AM Peak Hour

	Pedestrians Crossing				Green Man Called
	Crossed with Green Man	Crossed before Green Man appeared	Crossed without calling Green Man	Total	No of times Green Man called
0800-0815	9	1	4	14	6
0815-0830	5	1	10	16	2
0830-0845	2	6	4	12	3
0845-0900	5	2	2	9	3
Total	21	10	20	51	14

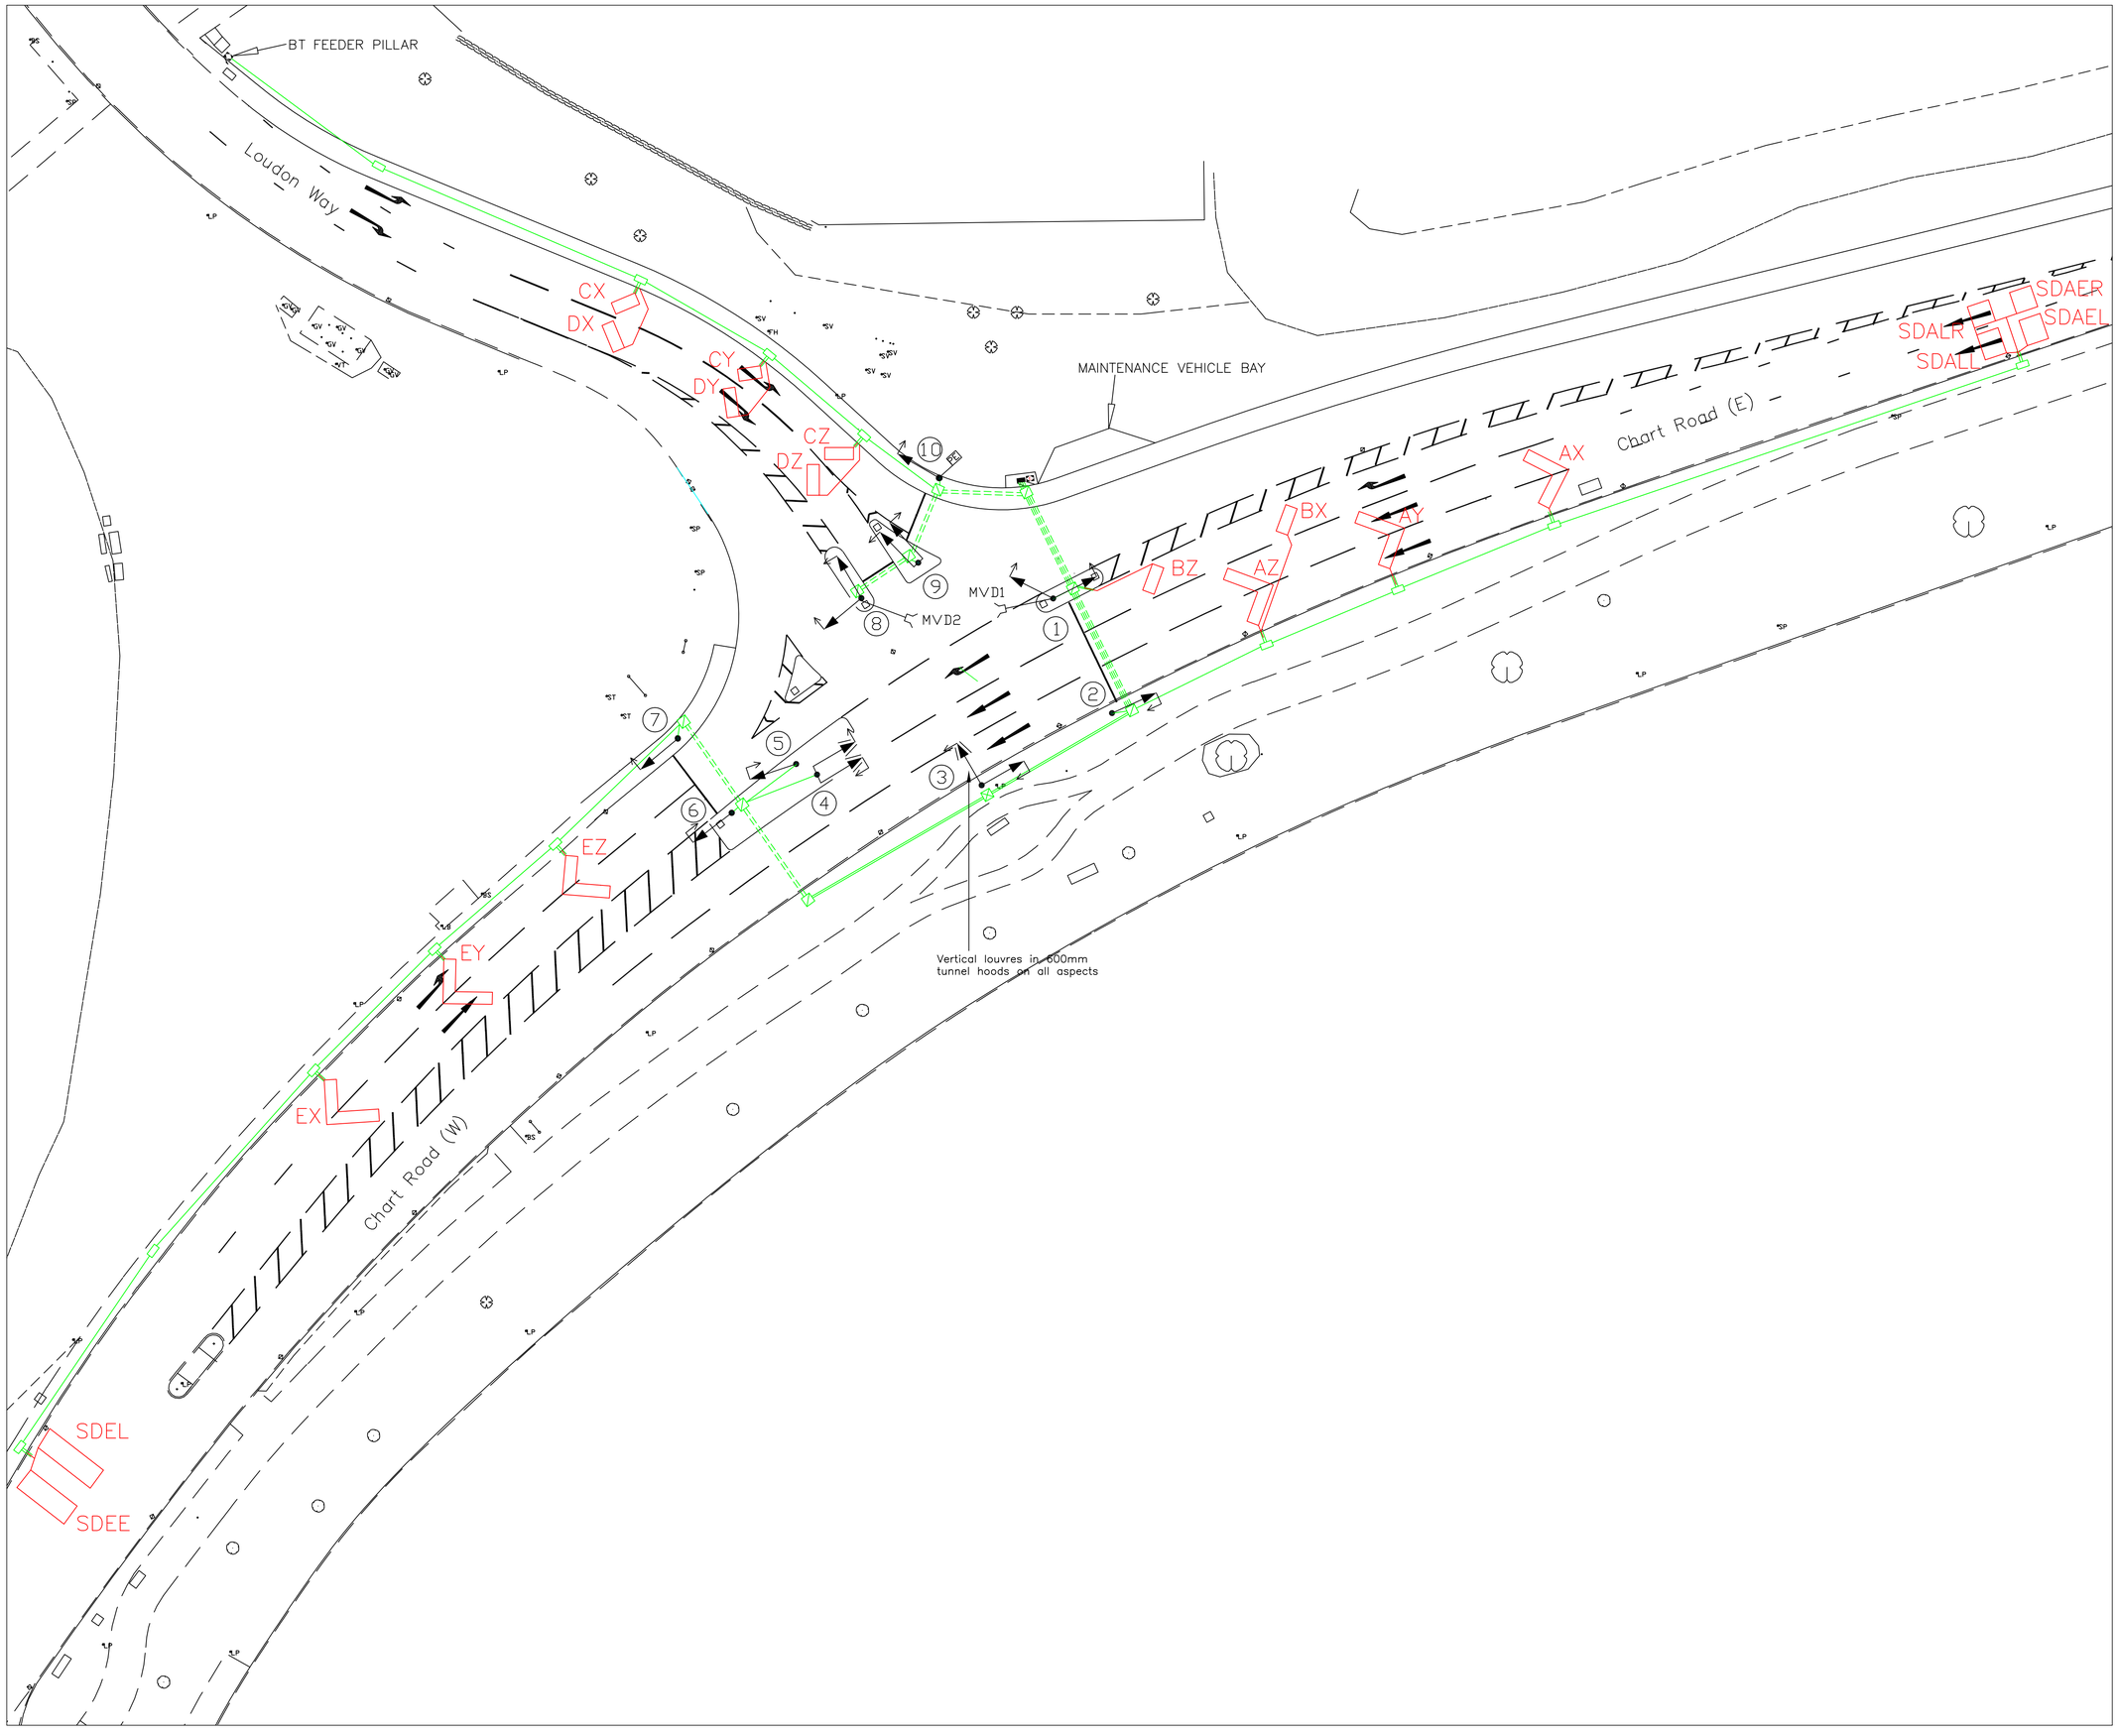
Table 2.4: Eastbound PM Peak Hour

	Pedestrians Crossing				Green Man Called
	Crossed with Green Man	Crossed before Green Man appeared	Crossed without calling Green Man	Total	No of times Green Man called
1630-1645	8	5	3	16	4
1645-1700	4	3	3	10	4
1700-1715	6	3	3	12	4
1715-1730	3	2	3	8	3
Total	21	13	12	46	15



Making Sustainability Happen

Appendix C Loudon Way Signal Data



Drawing Number

Notes

Key

- Junction box (no under kerb duct)
- Junction box (with under kerb duct)
- Junction pit (no under kerb duct)
- Junction pit (with under kerb duct)
- Shallow junction pit (no under kerb duct)
- Shallow junction pit (with under kerb duct)
- Duct FW/1 100 mm dia
- Duct FW/2 100 mm dia
- Duct FW/3 100 mm dia
- Duct CW/1 100 mm dia
- Duct CW/2 100 mm dia
- Duct CW/3 100 mm dia
- Signal controller cabinet
- Electricity supply pillar
- BT termination pillar
- AX Vehicle detector loop and identity
- Traffic signal
- Pedestrian signal with push button
- Pedestrian/ cycle on crossing detector
- Pedestrian/ vehicle presence detector
- Photo electric cell
- Layout of blister tactile surface modules (red)
- Layout of blister tactile surface modules (buff)
- Dropped kerb (not at signalled crossing)
- Roadstuds
- Existing lighting column
- Guardrail type PG/1 – HV (staggered infill bars)
- Kerb/ footway alignment
- Illuminated Traffic bollard
